1) Create a SparkSession with s3 credentials:

```
SparkSession spark =
SparkSession.builder().config("spark.hadoop.fs.s3a.access.key",
"AKIAIRAMZL2C6JZSO2RQ")
        .config("spark.hadoop.fs.s3a.secret.key",
"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").appName("S
aavnAnalytics")
        .master("local[*]")
        .getOrCreate();
```

2) Reading the data set from s3 location for user activity.We can change it to read the whole directory for training the model:

```
String s3path = "s3a://bigdataanalyticsupgrad/activity/
sample100mb.csv";
```

3) Loading metadata from s3 and loading it into data set

```
String s3path1 = "s3a://bigdataanalyticsupgrad/newmetadata/
*";

Dataset<Row> rawDatasetMetaData =
spark.read().option("header", "false").csv(s3path1).
            toDF("songId","artistId");
```

4) Finding the recency and frequency on raw data and then joined the result with Metadata to get the artistID's

```
Dataset<Row> clickStreamDataRecency =
datasetClean.groupBy("userId", "songId")
            .agg(functions.min("days_before").alias("recency"));

Dataset<Row> clickStreamDataFrequency =
datasetClean.groupBy("userId", "songId")
```

```
                    .agg(functions.count("*").alias("frequency"));
```

5) String Indexer to change the SongID to numeric to fit the model

```
StringIndexer indexer2 = new
StringIndexer().setInputCol("songId").setOutputCol("IND_songId");
      StringIndexerModel indModel2 = indexer2.fit(dataset);
      Dataset<Row> indexeddata2 = indModel2.transform(dataset);
```

//vector assembler to combine everything to features

```
        VectorAssembler assembler = new
VectorAssembler().setInputCols(new String[] {"IND_songId",
"frequency", "recency"}).setOutputCol("features");
        Dataset<Row> finalData =
assembler.transform(indexeddata2);

            //Model building

        BisectingKMeans BKmeans = new
BisectingKMeans().setK(301);
        BisectingKMeansModel  model = BKmeans.fit(finalData);
```

6) Grouping cluster ID's

```
Dataset<Row> predictionCount =
predictions.groupBy("prediction").agg(functions.count("*").alias("cou
nt"));

        //Dataset<Row> rawDatasetMetaData =
spark.read().csv("data/inputData/metadata/*").
            //      toDF("songId","artistId");
        Dataset<Row> datasetCleanMetaData =
rawDatasetMetaData.na().drop();
        Dataset<Row> datasetMf = predictions
                .join(datasetCleanMetaData,
```

```java
predictions.col("songId").equalTo(datasetCleanMetaData.col("songId")), "inner")
                .drop(datasetCleanMetaData.col("songId"));
```

7) Writing the grouped data to intermediate files which will be then converted to a single csv file:

```java
        Dataset<Row> grouped =
datasetMf.groupBy(datasetMf.col("prediction"),
datasetMf.col("artistId"))
                .agg(functions.count("*").alias("user_count"));
        Dataset<Row> maxCountRows =
grouped.groupBy(grouped.col("prediction"))
                .agg(functions.max("user_count").alias("max_user_count"));

        Dataset<Row> finalSet = grouped
                .join(maxCountRows,

grouped.col("prediction").equalTo(maxCountRows.col("prediction"))
                        .and(grouped.col("user_count").equalTo(maxCountRows.col("max_user_count")))
                        , "inner")

                .drop(maxCountRows.col("prediction"))

                .drop(maxCountRows.col("max_user_count"));

//writing the intermediate result

        finalSet.toJavaRDD().saveAsTextFile("/user/ec2-user/cluster-casestudy1/output/");
```

8) Calculating the CTR by iterating through the notification data and showing top five notification.

```java
List<Row> notifications =
notificationClickCount.join(rawNotificationArtistDataset,

rawNotificationArtistDataset.col("notification_id").equalTo(notificatio
nClickCount.col("notification_id"))
                                  , "inner")
                .select(notificationClickCount.col("notification_id")).d
istinct().takeAsList(5);
//          List<Row> notifications =
notificationCount.select("notification_id").takeAsList(5);
          for(Row notification : notifications) {
                String notificationId = notification.get(0).toString();

                List<Row> clickCountRows =
notificationClickCount.filter(notificationClickCount.col("notification_id
").equalTo(notificationId))
                                                          .select
("count").takeAsList(1);

                Long clickCount =
clickCountRows.get(0).getLong(0);

                List<Row> account_ids =
rawNotificationArtistDataset.filter(rawNotificationArtistDataset.col("n
otification_id").equalTo(notificationId))
                                                          .select("arti
st_id").collectAsList();

                long totalCluserWiseCount = 1;
                List<Integer> visitedClusters = new
ArrayList<Integer>();

                for(Row row : account_ids) {
```

```java
                    String accountId = row.getString(0);

                    List<Row> clusterIds =
finalSet.filter(finalSet.col("artistId").equalTo(accountId)).select("predi
ction").collectAsList();

                        for(Row clusterRow : clusterIds) {

                            int clusterId = clusterRow.getInt(0);

                            if(visitedClusters.contains(clusterId))
                                continue;

                            visitedClusters.add(clusterId);

                            List<Row> countRows =
predictionCount.filter(predictionCount.col("prediction").

equalTo(clusterId)).select("count").takeAsList(1);
                            long count =
countRows.get(0).getLong(0);

                            totalCluserWiseCount += count;
                        }
                    }                       if (totalCluserWiseCount !=
0) {

                        double ctr = (clickCount/
totalCluserWiseCount);
                        System.out.println("Notification: " +
notificationId + "\n" + "ClickCount: " + clickCount +
                                        "\n" + "Total
ClusterWise count: " + totalCluserWiseCount +
                                        "\n" + "Click Through
ratio: " + ctr);
```

```
                    }

            }
```

9) Command used for copying the jar file from local to ec2:

scp -i /Users/Navi/downloads/new_demo.pem /Users/Navi/eclipse-workspace/Practice/
target/PracticeQ1-0.0.1-SNAPSHOT.jar ec2-
user@ec2-52-90-26-142.compute-1.amazonaws.com:/home/ec2-user/

10) Command used to run the jar file in ec2:

spark2-submit --class Practice.Clustering.automobile\ --master yarn --deploy-mode
client \ --name clustering-demo --conf "spark.app.id=park_aws_run" \ /user/ec2-user/
PracticeQ1-0.0.1-SNAPSHOT.jar

Output from EC2 console:

```
